

‘Box Method’ for Derivatives

The following indicates the derivative of various common functions by filling in a box—ignoring the chain rule. For example, to find $\frac{d}{dx} \tan(x^3)$, we fill in the box for $\frac{d}{dx} \tan(\square) = \sec^2(\square)$ with x^3 and remember to apply the chain rule—which says to multiply by the derivative the contents of \square . Therefore, $\frac{d}{dx} \tan(\square) = \sec^2(\square) \cdot \frac{d}{dx} x^3 = \sec^2(\square) \cdot 3x^2 = 3x^2 \sec^2(x^3)$.
