

Check-In XX/XX. (*True/False*) XXXXXX

Solution. The statement is XXXX.

20 Every linear function must have a constant rate of change.

24 If $f(x) = x + 3$ and $g(x) = 5$, then $(f \circ g)(0) = 15$.

25 The function $f(x) = 3(x + 5)^2 - 6$ is quadratic with vertex $(5, -6)$ and has a maximum possible output.

26 A quadratic function $f(x)$ has a y -intercept, two x -intercepts, and either a maximum or a minimum output.

27 If the discriminant of a quadratic function $q(x)$ is -16 , then $q(x)$ does not factor over the real numbers but does factor 'nicely' over the complex numbers.

$3 \pm 2i$
